

Setting up Visual Studio Code Server

Kai Du

2020-12-10

This blog will explain how to set up a visual studio code server in an AWS instance (Ubuntu 18.04). The steps mentioned here are basically the commands I executed in my instance (launched using ami-0dba2cb6798deb6d8 64-bit x86) with security group rules allowing port 22,80 and 443 for all.

Note (October 2026): this post was written in 2020 and has not been re-tested. Ubuntu 18.04 and code-server 3.4.1 are long out of date, so use current versions and check the code-server documentation before following these steps. Test1234 is only an example: choose your own strong password, and do not leave ports open to everyone on a real server.

Step 1: `sudo apt update`
